Abstract not available for DE3932228 Abstract of corresponding document: US5020969

Since a peripheral-flow pump according to the present invention has a peripheral-flow impeller having a cylindrical staircase shape whose outer diameter increases in one direction only like a staircase, a stator, which conventionally has been of a complicated configuration composed of two pieces, can be formed into an integral molding without any deterioration in pump performance. Accordingly, the production of pumps is facilitated.

Prüfungsantrag gem. § 44 PatG ist gestellt

(54) Turbovakuumpumpe

Die Turbovakuumpumpe hat eine Umfangsstrompumpe mit einem Umfangsstromlaufrad (30), das die Form eines zylindrischen Treppenhauses hat, dessen Außendurchmesser nur in eine Richtung wie bei einem Treppenhaus zunimmt sowie einem Stator (31). Ein solcher Stator hat herkömmlicherweise eine komplizierte Form und ist aus zwei Teilen zusammengesetzt. Bei der erfindungsgemäßen Ausgestaltung des Laufrads (30) kann der Stator einfach in einem Stück hergestellt und montiert werden, ohne daß dies die Pumpenleistung verschlechtert.
